

Quick Start Guide

Turn your messy daily notes into neat, professional logbook entries — and build your weekly summaries and final SIWES report automatically. *[This guide shows you how, step by step.](#)*

 Write your day in plain English

 Get a clean 35–70 word entry

 Build your final report

What does this app do?

You simply tell it what you did at work each day — even in rough, unordered words. It rewrites it into a short, professional paragraph that fits exactly inside the small **“Description of Work Done”** box in your official SIWES logbook.

DAYS DATE	DESCRIPTION OF WORKDONE
MON.	Set up my development environment with VS Code and Git, then practiced writing SQL queries on the company’s customer database under my supervisor’s guidance.

It also remembers everything you save, so at any time you can tap a button to **Generate a Weekly Summary**, a **Monthly Summary**, or **Build your Final Report** — all consistent with your daily entries.

GOOD TO KNOW

The app is free to use. It runs on a free “AI key” from Google called a **Gemini API key**. Everyone uses their own key, so your work stays private. The next page shows exactly how to get one — it takes about 2 minutes and needs no payment card.

Get your free Gemini key

A one-time setup — about 2 minutes

A “Gemini API key” is just a free password that lets the app talk to Google’s AI on your behalf. Here is how to get yours.

- 1 Open the Google AI website**
On your phone or computer browser, go to:
aistudio.google.com/apikey
- 2 Sign in with your Google account**
Use any Gmail account. If you don’t have one, create a free Google account first, then return to the link above.
- 3 Click “Create API key”**
You’ll see a blue button that says **Create API key**. Tap it. If it asks you to pick a project, just accept the default one it suggests. (*It is free — you will not be asked for a bank card.*)
- 4 Copy your key**
A long code appears, starting with **AIza...**. Tap the **Copy** button next to it to copy the whole thing.
- 5 Paste it into the app**
Back in the SIWES Logbook Assistant, paste the key into the “**Gemini API key**” box on the Setup screen (or when the app asks you for it), and tap **Save**. That’s it — you’re ready.

YOUR KEY IS PRIVATE

Your key is saved only on your own device (inside your browser). It is never shared with anyone, and it is only used to send your notes to Google’s AI. Your logbook entries are yours alone.

KEEP IT SAFE

Treat your key like a password — don’t post it publicly or share it in group chats. If you ever think someone else has it, just create a new one and paste the new key into the app.

Using it every day

Three simple steps

- 1 Tell it about your day**
In the **Assistant** tab, type everything you did — however messy. Example: “*Today I helped install network cables, watched how the switches are set up, and wrote notes about the office setup.*” Then tap **Send**.
- 2 Check and save the entry**
The app gives you a tidy 35–70 word paragraph. If it looks right, tap **Save to logbook**. You can also tap **Copy text** to paste it into your paper logbook.
- 3 View or print your logbook**
The **Logbook** tab shows a Weekly Progress Chart just like the real one. Use **Print** for a clean copy, and the **Weekly / Monthly / Final Report** buttons to generate your write-ups when you need them.

If your free usage runs out

Google’s free tier gives a generous amount of use each day. If you reach the daily limit, the app will show a message:

“Your key’s free quota is used up.” You have two easy choices:

- **Wait until tomorrow** — the free limit resets each day, then keep going.
- **Paste a different key** — create another free key (you can use a second Google account) and paste it in to continue right away.

NOTHING IS LOST

Your logbook, your profile, and all your saved entries stay exactly as they are. Changing the key does not erase anything — the app still remembers your name, your firm, and every day you’ve recorded. You just carry on where you left off.

Need help?

If a key doesn’t work, make sure you copied the **whole** code (it’s long), then paste it again. You can always tap the  **key** button in the app to view, replace, or remove your key.
